

◆ RWANDA INNOVATION SHOWCASE • 2026

GHOST

Use a computer
just by

A voice assistant built on a school Chromebook.
No pay-per-use bills.

[YOUR NAME] • [YOUR CLASS] • [SCHOOL]

Computers expect you to **type fast** and **read small text**.

Typing is hard

for beginners, children,
and people with hand or
movement difficulties

Reading is hard

for people with weak
eyesight, especially on
small screens

Time is short

shared computers, busy
lessons, busy teachers

| When a computer is hard to use, people miss out.

◆ THE IDEA

Say what you want.

You speak
or type, if you prefer

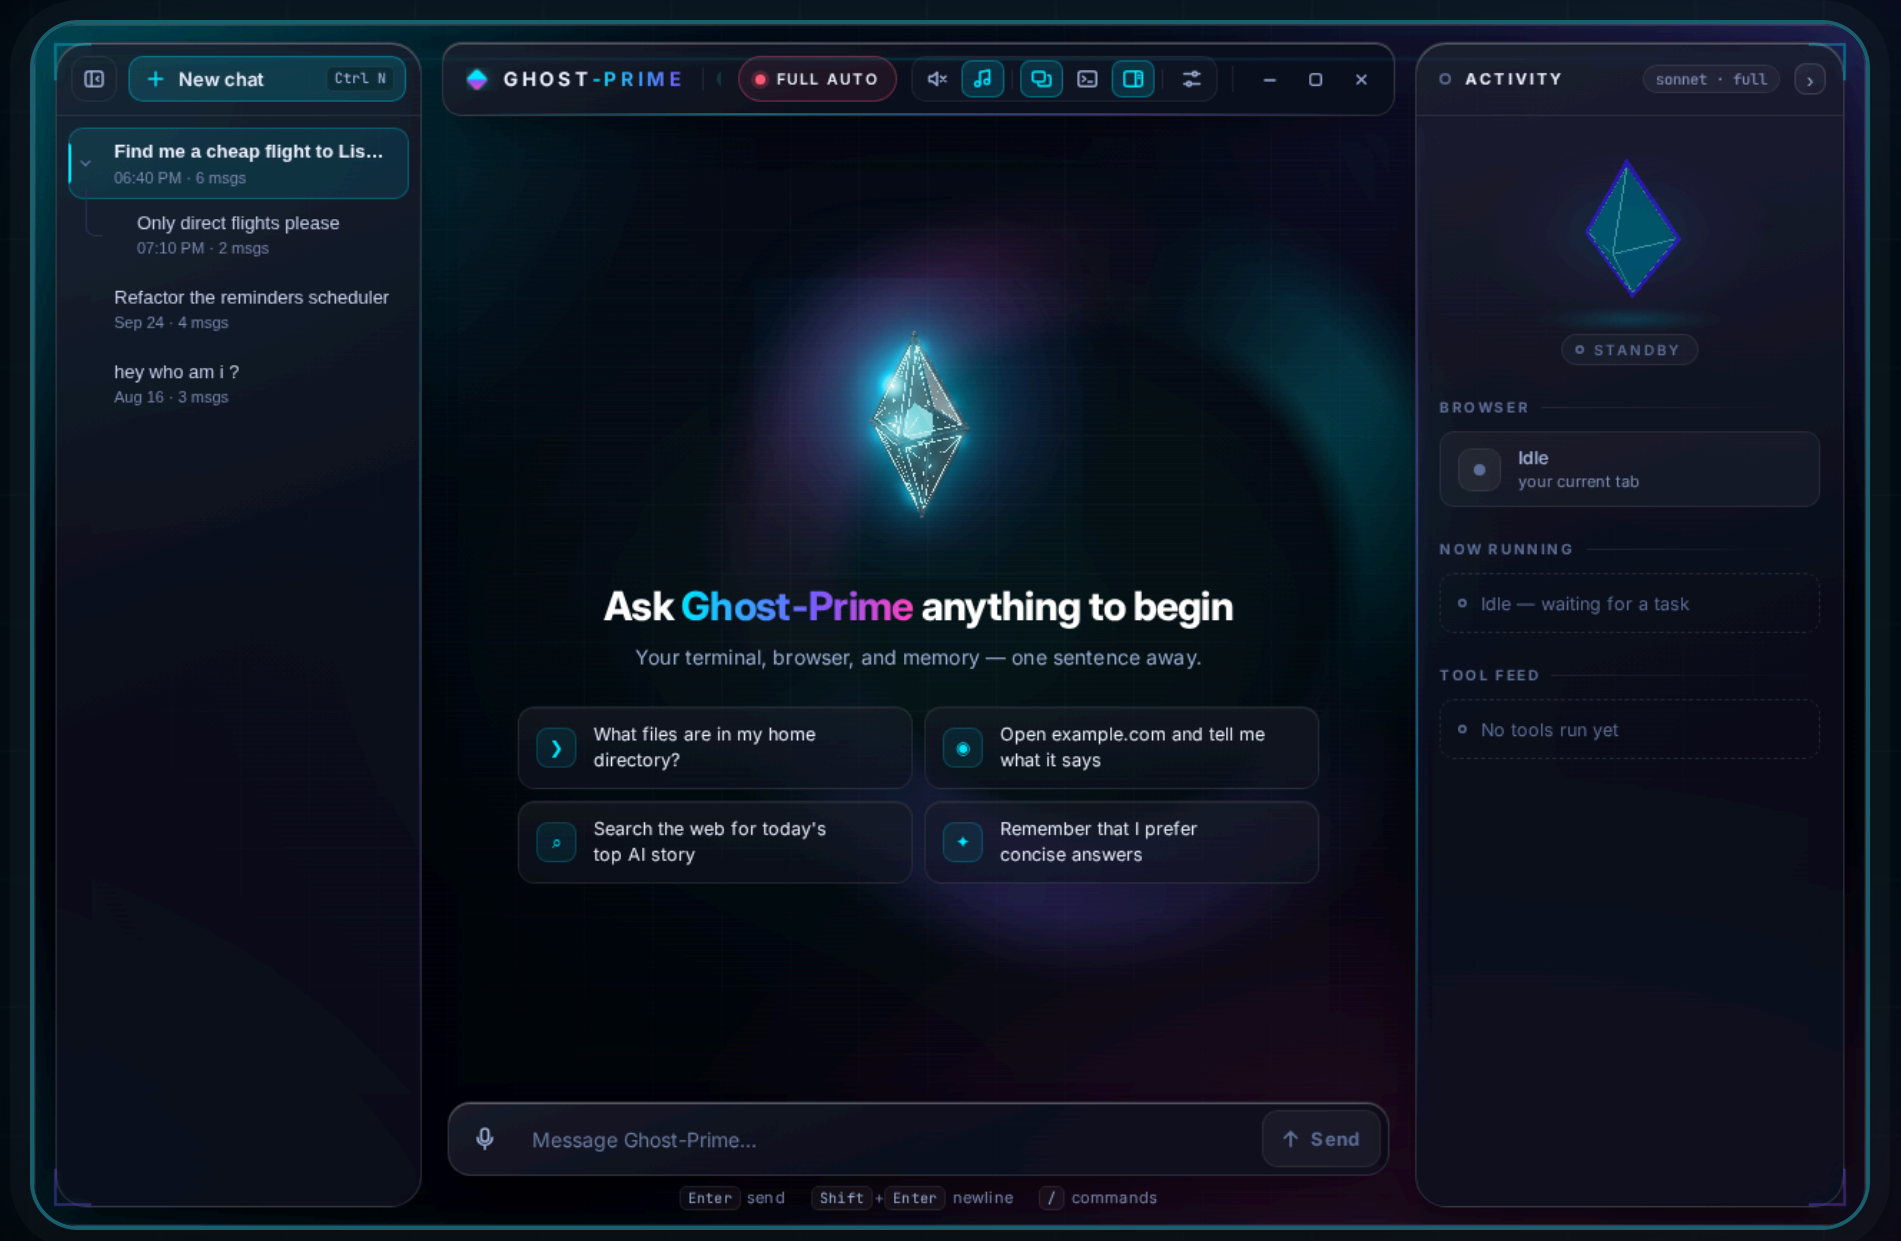

AI plans the steps
Claude or Gemini

It does the task
websites, files, commands

It tells you
and can read the answer aloud

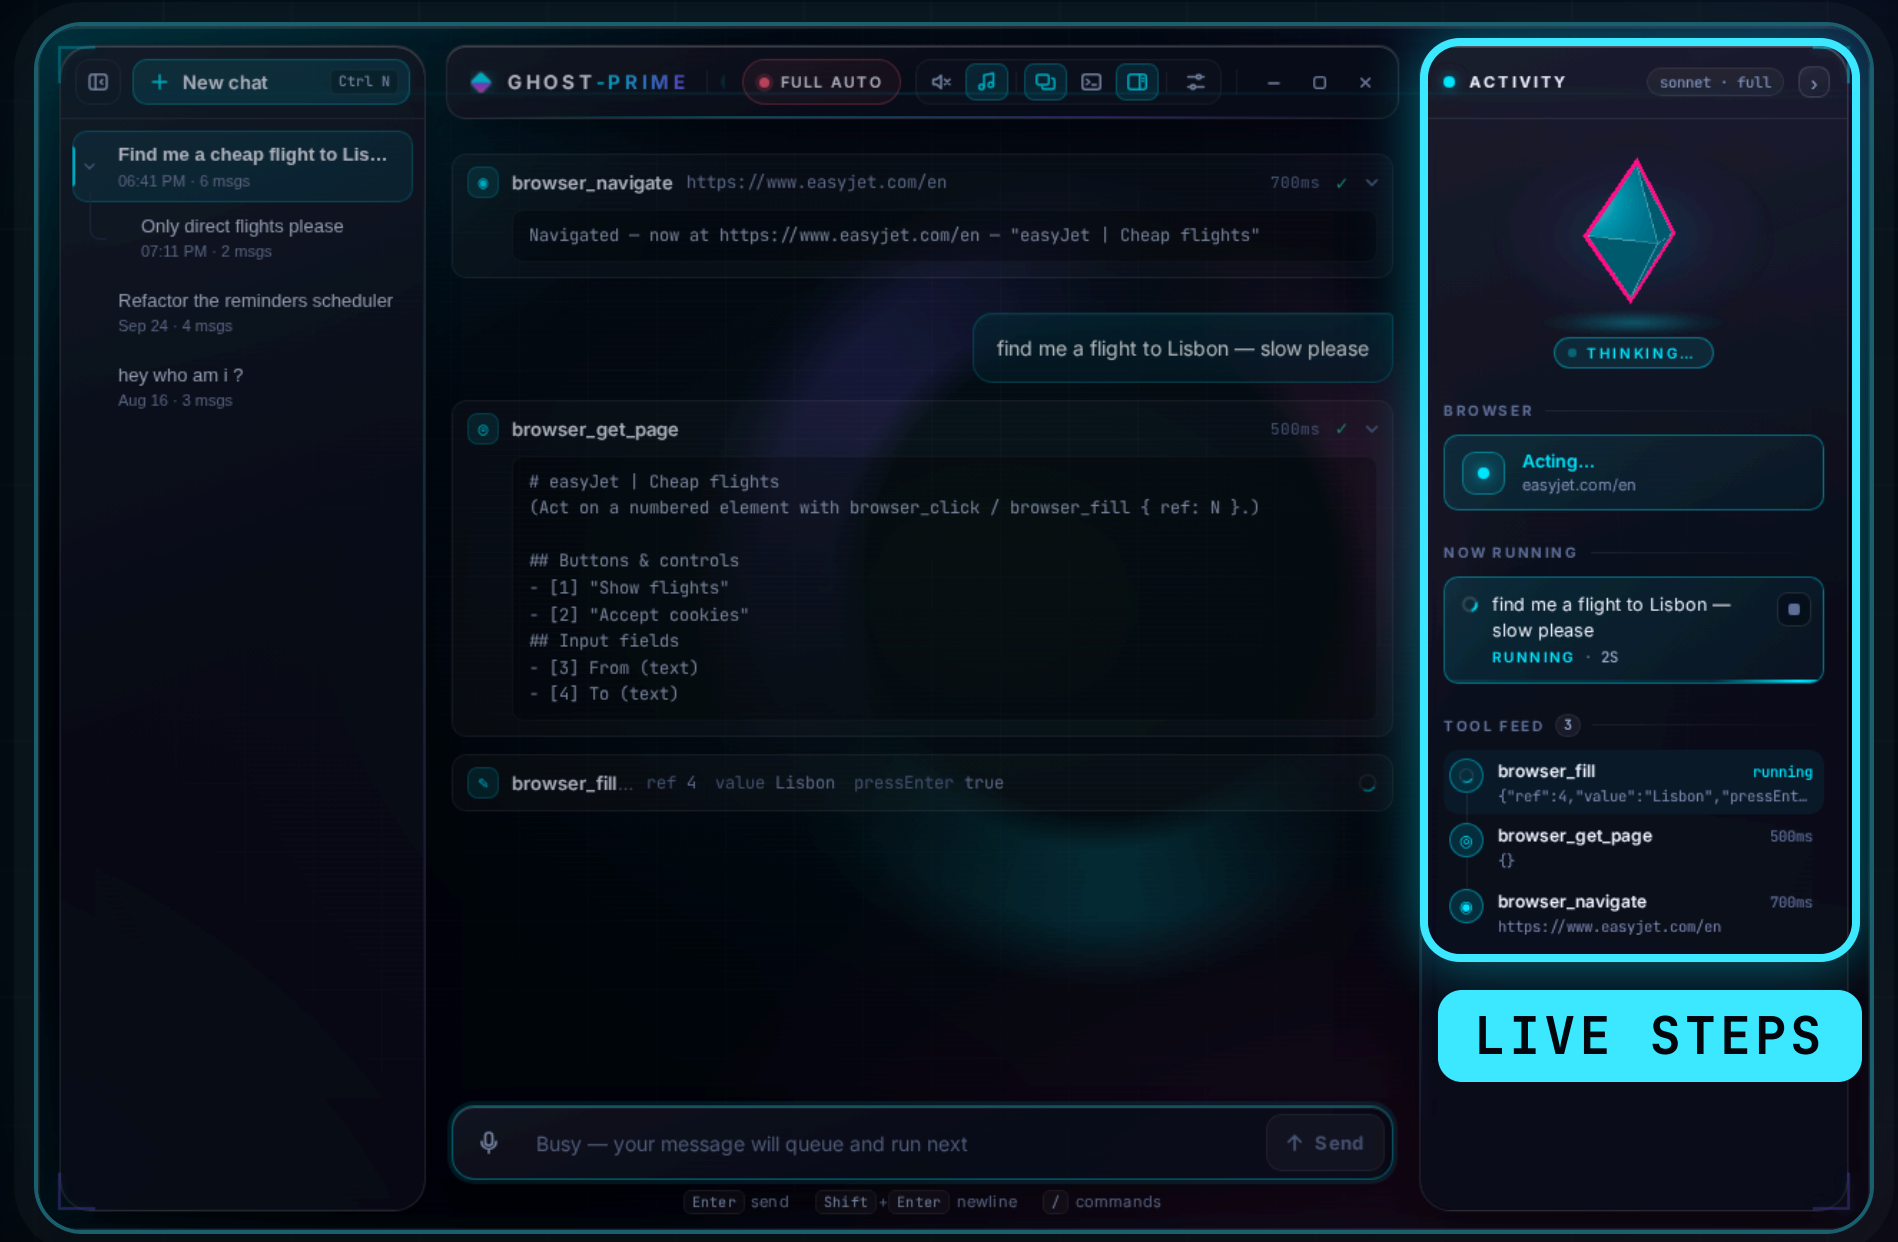

The Ghost-Prime app, waiting for a request

Watch it work

- 1 I ask out loud
- 2 It opens a website and clicks
- 3 It saves what it found
- 4 It reads the answer aloud

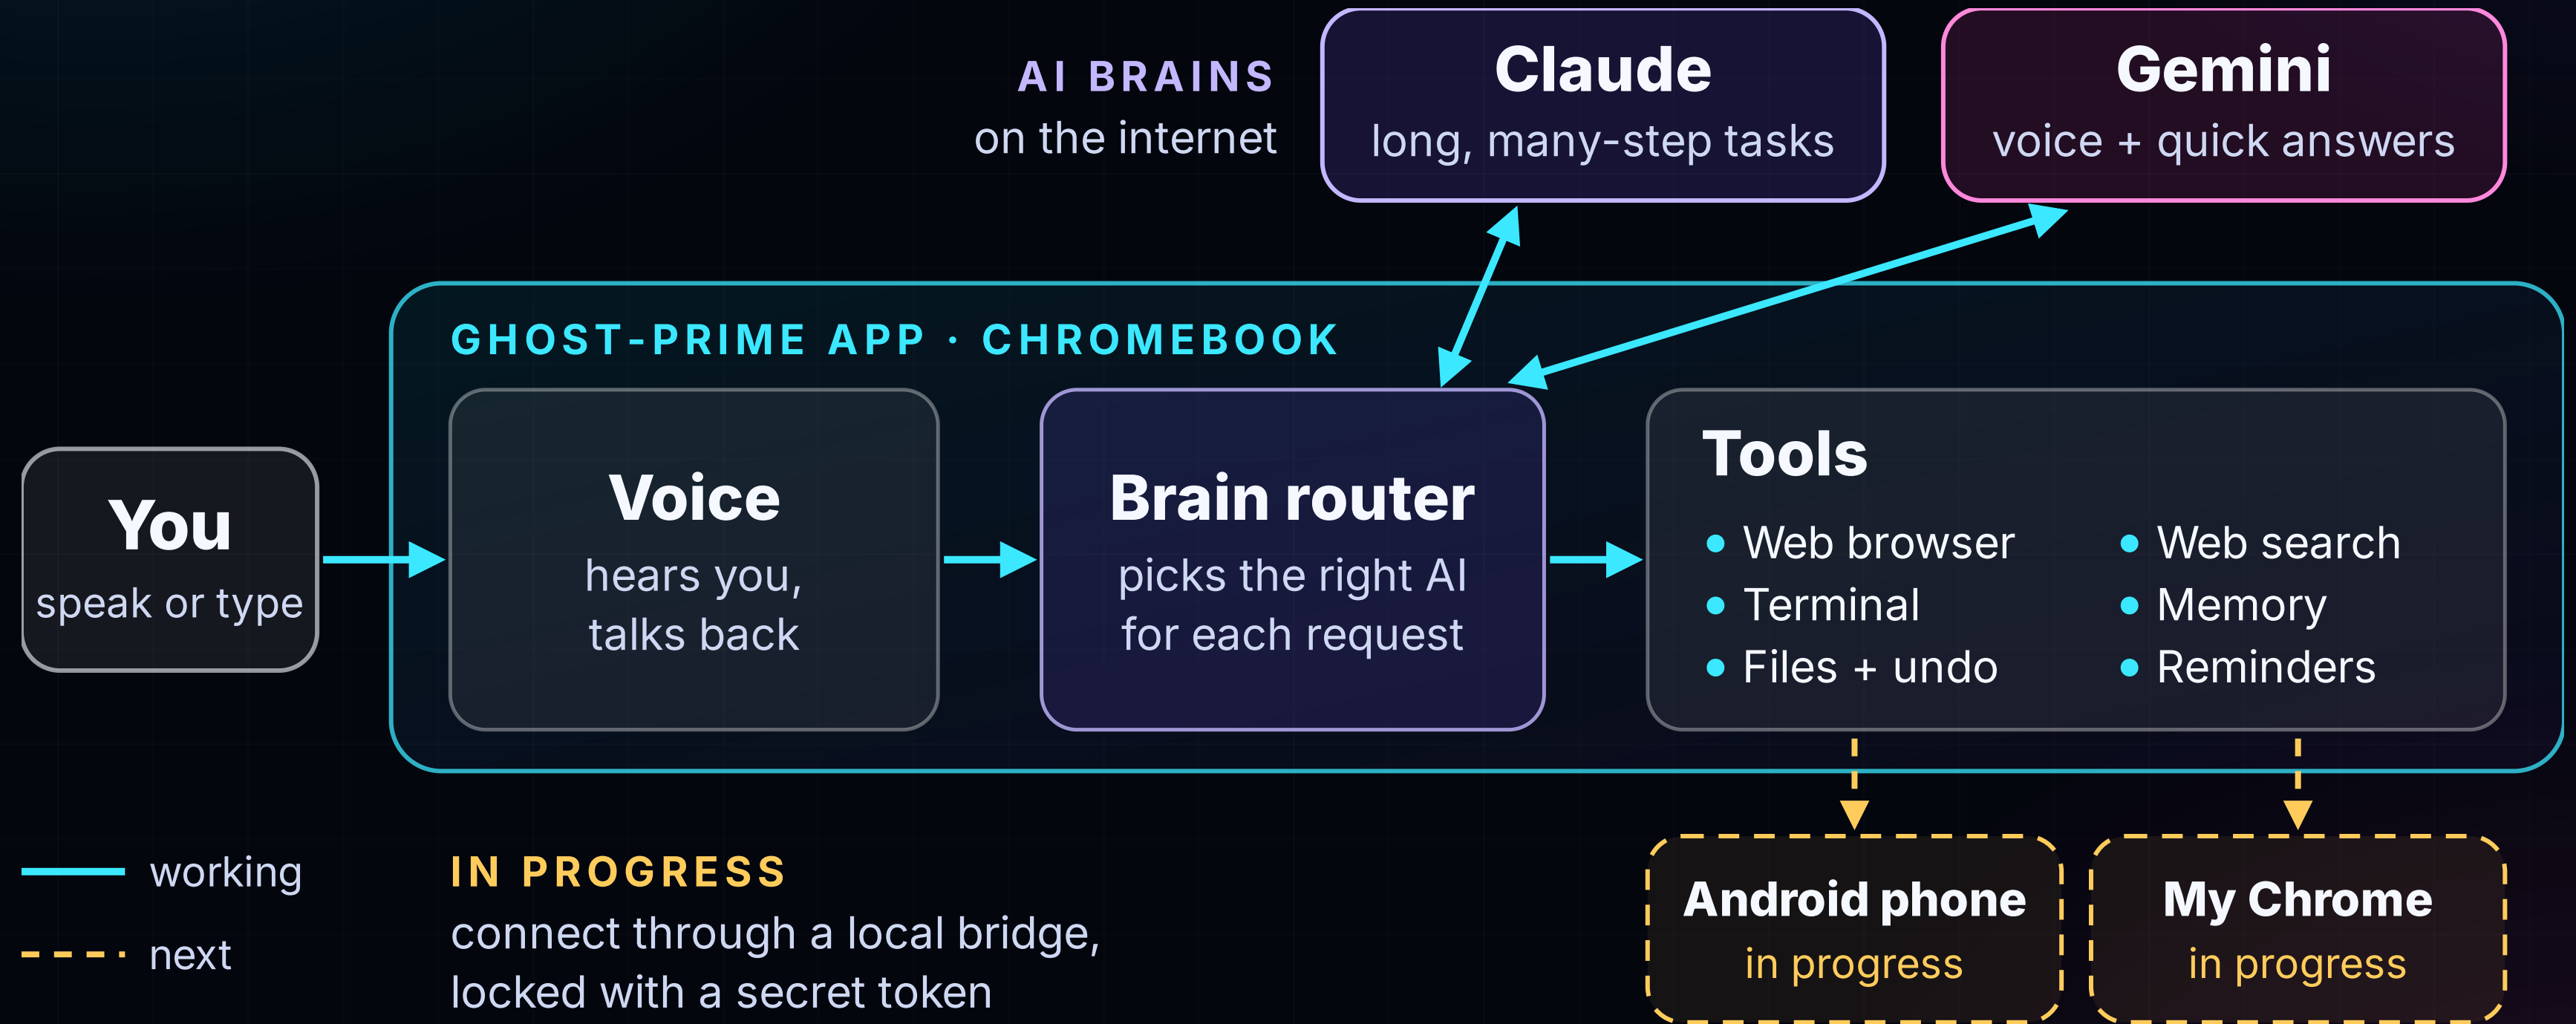

You see **every step, live.**

Ghost-Prime in the middle of a task (sample data)

◆ HOW IT WORKS

One app,

What it can do

Listens and talks back

BY HAND

Opens websites, clicks and types

Runs commands in a live terminal

Moves and tidies files, with undo

Searches the web

BY HAND

Remembers you between chats

Sets reminders

Understands pictures

tools it can use

automated checks
passed, 0 failed

months of building

BY HAND

= checked in the real app, no automated test yet. Everything else passed automated tests.

You stay in control

SAFEGUARDS

Choose how free it is

PLAN (look only) · AUTO · FULL AUTO

Block websites

or allow only a safe list

Undo file changes

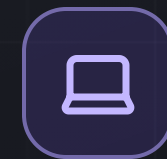

moves, deletes, new files

Only my devices connect

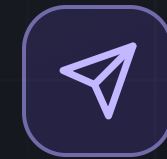

locked with a secret token

YOUR DATA

Stays on the Chromebook

chats, memories, reminders, files

Sent to the AI to answer

your request and the pages it reads

Voice goes to Google

or switch to offline voice

Don't share secrets

Google's free tier may use what you send

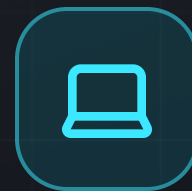

Not yet: an "Are you sure?" check before big actions. It's next on my list.

No pay-per-use bills

new costs to run it*

No API bill. No servers.
No gaming PC.

HARDWARE

A school Chromebook

plus a low-cost Android phone, for phone control (next)

AI

Google Gemini free tier

plus a Claude subscription I already had

SOFTWARE

Free and open source

runs on the Chromebook itself

* Claude uses a subscription I already had. It can also run on Google's free tier alone (less capable).

Who it helps

Students

"Open the page about photosynthesis and read it to me."

Teachers

"Remind me at 5 to mark the tests."

People who find typing or reading hard

Speak instead of typing. Listen instead of reading.

Anyone new to computers

Plain words instead of menus and tiny buttons.

| When a computer is easy to use, more people can learn with it.

Where it goes

IN PROGRESS

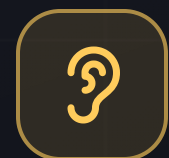

Control an Android phone

works on a simulated phone; real phone next

Control my own Chrome

needs the school to allow extensions

Hands-free "Hey Ghost"

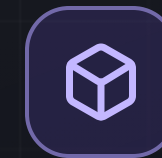

built, not installed yet

PLANNED

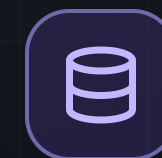

"Are you sure?" check

before big actions

Easy installer

so other schools can try it

Smarter memory

finds things by meaning

| The goal: **anyone** can use a computer and phone just by talking.

◆ THANK YOU

Questions?

Come and talk to Ghost-Prime
at the booth.
